

## Viatec UK Alumark Pedestrian crossing studs

Used for marking pedestrian walkways at road crossings and other applications, such as highlighting car parking bays. To fit, use a 30mm drill bit to drill a hole in the road / tarmac surface of 75mm depth. Using gloves and eye protection, carefully pour hot molten stud grout (available in 25 kg volumes) into the drilled hole. Slowly lower the stud shaft into the hole, which forces the grout out onto the road surface around the stud base. Press down to secure in place.
