Photo shows anti skid aggregate throughout the material

Viatec Overbanding tape provides an instant waterproof seal over cracks or reinstatement joints in asphalt of up to 5mm wide. The tape prevents water ingress and resultant cracking and fretting and eventual breakdown of the asphalt

Unlike other preformed overbanding, Viaseal contains high antiskid elements throughout the body of the material, not just a surface dressing. This means the skid resistance value remains at 60SRV all through it's service life, not just on application. It's also a one step process so quicker on site.

Use of a special plasticiser means the material remains flexible for application in cold weather but does not compromise performance in service during hot weather.

Application by gas torch which also aids adhesion in wet and cold conditions.

Rolls are 5m x 35mm, packed 12 per box.
